

Group Lifecycle Management for any Directory

A powerful web-based group management tool allows administrators to delegate directory administration to end users based on permissions and workflow designed by IT.

What is GroupID Self-Service?

- Enable end users to update their own profile information and attest to their organizational structure.
- An administrator can approve group creation, membership changes, or changes in attributes.
- Support industry leading directories such as Microsoft's Active Directory, Azure Active Directory, generic LDAP based directories, and messaging platforms such as Microsoft's Exchange Server, Office 365 and Google G Suite of Business Applications.

What Does GroupID Self-Service Offer?

Complete Group Lifecycle Solution

- Manage group creation, expiration, and deletion to maintain accuracy.
- IT can provide group management capability to end-users while keeping control.
- Group owner attests to staffing (transfer, terminate, and update.)
- Easy to set workflow. Ensure security and accuracy with IT control.

Creation

Provide workflow to ensure that groups are approved and meet naming conventions.

Expiration

Define a lifecycle for group renewals. Group owners are notified before the expiration, giving them time to renew it.

Use

Allow owners to manage groups and users to opt-in and opt-out during a group's useful life.

Deletion

Wait a set period of days to delete expired groups, giving the owner a chance to "get it back".

Delegated User Attribute Management

- End users can manage their attributes, change passwords, and manage workflow requests through a customizable web interface.
- Users are empowered to transfer employees, establish dotted line management responsibilities and when necessary, disable users who are leaving the organization.
- User lifecycle keeps organizational hierarchies accurate.

Complete customization

GroupID Self-Service allows IT to set fields to view, edit, or hide contingent on a highly customizable set of rules.

Log all changes

GroupID Self-Service maintains logs of all changes for workflow approvals.

Administration control

Give a manager control over the profiles of their employees or delegate to a human resource specialist.

Notification & Workflow

Create workflow on any attribute changes with approvals going to whoever is designated (managers, HR, help desk, admins etc.) Customizable and powerful workflow gives IT confidence in delegating.

Product Features

Group lifecycle

Set expiration policy on groups. Group expiration notification with renewal capability.

Join & leave groups

Users can opt-in or opt-out of groups depending on their security levels.

Workflow on group creation

Users can create groups but need approval by IT or their manager. Enforce naming conventions or security levels.

Group security settings

Define access level of groups (public, semi-private to private).

Phonebook access

Easily deployable the "Phonebook" role of Self-Service allows users to search and list content of users or contacts in the directory but not allow

Manage your own groups

Group owners can manage the membership, lifecycle, and delivery restrictions on their groups.

Multiple owners

All owners receive the same rights and workflow notifications.

Temporary membership

Group owners are empowered to grant temporary access, or temporary removal.

SharePoint Integration

IT administrators can safely delegate access to security group management.

Cross forest support

Built-in support for organizations with a cross-forest configuration. Delegate control in environments where there are forests with established trust relationships.

“

Before Imanami, I had to staff several employees just to make changes. That is no longer the case. The products were easy to install, Imanami was great to work with and the systems virtually run themselves. What more could you ask for?”

Mark Campbell - CIO, City of Atlanta
